DOVAHKIIN'S META-DREAMLINE · PART II

DJGuita & the Alchemists II: The Chain

You now have viryl, intellijend and Alex in the room. This page shows how they fit one pipeline, what we measure at every step, and the few moves that matter now. **Nothing gets released or spent without your yes.**

Prepared for Olga by Jeffrey's engine crew · November 7, 2026 · a plan for your review, not a contract · it follows the October 26 page and keeps its numbers.

I The goal, in numbers

Your goal in your words: targeted ads running day and night, listeners sent to your Spotify, YouTube and Instagram, and a reliable income. In numbers, that income (near $5,000 a month, as you told them) means well over a million streams a month across the catalog. That is a 100-fold climb from the October read, and it comes from releases and Spotify's own programming compounding. Ads are the match, not the fuel. These four numbers say whether the fuel is catching:

STREAMS PER LISTENER

1.5 → 2.0

Brujeria today, and the first target. The one number Spotify reads as "they came back".

PROGRAMMED SHARE

70%

of Brujeria's streams come from Spotify's own playlists, radio and mixes. The free engine. An ad is judged by what it adds to the other 30%.

SAVES + ADDS

15 / 100

9 playlist adds and 6 saves per 100 Brujeria listeners. The signals every post and ad asks for.

COST PER CLICK

your bar

under $0.20–0.35 in the US and Europe, under $0.10 in Mexico, Colombia and Spain, from your own ads guide.

2 One chain, eight steps

The eight steps never change. Who performs each one does. Here is the chain with your tools in it today, the number we watch at each step, and what replaces the vendor later.

STEP	TODAY, WITH YOUR TOOLS	WHAT WE MEASURE	LATER, IN-HOUSE
1 Source	Suno songs. Alex re-plays Demons In My Closet as real instruments and vocals.	songs released per six weeks; which songs have a played master	a stem split, then session players on flat fees
2 Release	DistroKid, with the Made-with-AI label; a pitch to Spotify's editors at least 7 days before release.	releases pitched; days of runway before each one	the same. DistroKid is a pipe, not a middle-man.
3 Listen	Spotify for Artists (team access since Oct 25) read into MUSEDASH, your dashboard. It now re-renders every 30 minutes.	the date of the numbers on the page, shown in its stamp	your own Spotify for Artists exports read in automatically; then Spotify's public artist data daily
4 Learn	countries, cities, playlists, saves: the October read	share of listening per market; adds and saves per 100 listeners	the same read, weekly, automatic
5 Make	**viryl**: beat-synced vertical videos from one song, many hooks and looks. 240 credits a month, about 200 videos, licensed.	videos per song; the hook landing at 0:02; three reel types	our own cutter, already proven on the test songs
6 Place	**intellijend**: Instagram ads from *your* Meta ad account, through their tracked page, to Spotify. A short burst at release.	ad-driven streams, read as the lift in the non-programmed 30%; cost per new listener; click cost against your bar	your own Meta Ads Manager, with the settings from your guide
7 Measure	intellijend's dashboard and Spotify for Artists	the Monday read (section 6)	MUSEDASH's Monday read, automatic
8 Repeat	by hand	moves proposed, moves approved	a queue on your phone that waits for your yes

What "24/7" means here. Steps 3, 4, 5, 7 and the proposing half of 8 run without you, all day, every day. Steps 2 and 6, releasing and spending, wait for your yes. A vendor's "always-on" campaign is still a daily budget you set; ours reads it every half hour and proposes the next move.

3 viryl and intellijend: use them, learn them, then own the shape

One company, two tools. Both welcome emails are signed by Nico, and both carry the same address. viryl makes the videos; intellijend places the ads. Their strategy note says what our October page said: Spotify recommends a song only after real listening tells it who the song is for, so the job is to get real listeners in early and let Discover Weekly, Radio, Autoplay and Release Radar carry the rest.

The good news. intellijend runs the ads from **your own Meta account**. The targeting data, the pixel events and the spend history stay yours. That is the shape we wanted, with a vendor at the controls for now. Aura was the opposite: ads from its account, a 20% fee on top of the ad money.

Where it is still a vendor. A subscription on each; their landing page sits between the ad and Spotify; their burst is built for a release week, not a floor that runs all year.

The plan. Run one full cycle on your next release. We read what their burst added to the non-programmed streams and what each new listener cost. Then we run the same shape from your account, with no subscription, judged by the same numbers.

The one blocker today: your Meta connection

intellijend's Getting Started guide showed **0 of 5** required steps done on November 7. Nothing launches in their system, or in ours, until these are done (ours needs the same Meta Business account):

- watch their getting-started video;
- set the beneficiary and payer in Meta;
- share your Instagram profile with the ad account;

- add intellijend to the allowed domains in Events Manager;
- turn off automatic adjustments.

Their $30 setup call is on offer if you would rather do it with them on screen. After the connection, their catalog sync takes up to 24 hours.

4 Aura and Boost Collective: where they fit

NAME	WHAT IT DOES	VERDICT	WHY
Aura	runs Instagram and Facebook ads to Spotify from its own account; 20% platform fee on top	REPLACE	Its Angel Face campaign produced about 110 non-programmed streams in 14 days. intellijend already does this job from your account. Let anything mid-contract run to its end while we measure it; do not renew.
Boost Collective	paid playlist placements and campaign bundles	REPLACE	Paid placement on third-party playlists is against Spotify's rules and risks streams being removed. If a bundle is already paid, we measure what it did against the programmed share, then stop.
viryl	makes the videos	USE, THEN REPLACE	Good at what it does; the credits roll over. Our cutter takes the step when the numbers say it can.
intellijend	places the ads from your account	USE, THEN REPLACE	The right shape with a vendor at the controls. One cycle teaches us their cadence and their numbers.
Alex (FreshlyBaked)	producer; re-plays Demons In My Closet	CRAFT, YOUR TERMS	Section 5.

5 Demons In My Closet: the Alex arrangement

As you described it: a stem split first, then Alex re-plays the parts as professional instruments and vocals, or your own. He did the guitars; you want a cuatro. This is step 1 of the chain, the Source, and it is the step that makes a song sellable.

Why it matters. As the US Copyright Office reads it today, a recording made entirely by AI cannot be registered as yours. A human-performed master made from the AI reference can. That is what lets a song be licensed for film and TV, sold, or carried into a label deal. The 35% buys that today.

Your terms stay. No open-ended points on masters. Flat fees or a capped test deal, as you did (35%, down from 40%, on this one song). The going rate you know for a producer, about 20%, is the ceiling, not the floor. Alex's credits are a reason to keep him as craft on your terms, not a reason to widen the deal.

Later. The stem split is a tool step. The re-performance is session work on flat fees. Each song's stems, takes and credits get booked as they come in, so nothing is lost between producers.

Two decisions are yours: the release date (we pitch Spotify's editors at least seven days before it), and whether Angel Face gets re-cut before any money goes behind it.

Keep the Made-with-AI label on your releases. Brujeria carries it, and Spotify's programming carried the song anyway. Honest labeling costs nothing with the algorithm and protects the account.

6 Your numbers, live

- **Now:** MUSEDASH re-renders every 30 minutes, with the date of its numbers written in its stamp, so a fresh page never pretends to fresh numbers.
- **Next:** your Spotify for Artists downloads (Audience and Songs) read in automatically. We export them with the team access you gave; nothing touches your account and nothing is scraped. Then Spotify's public artist data (followers, popularity) daily.
- **Every Monday:** streams, listeners, streams per listener, saves, playlist adds, the programmed share, the top five countries, and what each ad dollar bought. You approve the week's moves from your phone.

7 What we need from you

DO	Finish the Meta connection in intellijend (the five steps in section 3). This is the one step between you and every campaign, theirs or ours.
DECIDE	The Demons In My Closet release date, and whether Angel Face gets re-cut first.
TELL US	The day your first intellijend campaign goes live, so the read starts the same day.
KEEP	The Made-with-AI label on every release. It is working.
IF NOT YET	From the October page: sign up with ASCAP or BMI as both writer and publisher (Yukiyu Records), and with SoundExchange. Time Flies is on radio and that money waits until you do.

8 The order of moves

1. Meta connection

The five steps. Everything else queues behind this.

2. Your numbers flow in

Your Spotify exports become the live feed; MUSEDASH shows them every half hour.

3. One intellijend cycle

On the next release, measured against the programmed share: what the burst added, at what cost per listener.

4. Demons In My Closet

The date, the editor pitch seven days before, Alex's played master.

5. Three small tests of your own

From your Meta account beside theirs, $10–20 a day each for two weeks: Mexico and the US Latino cities in Spanish; Brazil in Portuguese; Turkey and Poland with the animation and no words. Judged by your bar.

6. Replace on a number

Never on a hunch. The vendor that loses to your own account on cost per listener is the one that goes.

The rules, still yours

- Your masters stay yours. No points on masters for contract work.
- Nothing is released, posted as an ad, or spent without your yes.
- You do not have to be on camera. The videos come from art, lyrics and animation; you appear when you choose to.
